

T-MAX™

The first choice for interior plasters and decorative materials

The T-Max™ is a real solution for applying plasters, rather than just a spraying machine.

1 person handling

We designed this new sprayer, so that one person can use it: easy to handle, use and clean.

Professional finish

You'll be amazed by the high quality finish of the sprayed material, reducing scraping of the material to a minimum.

Comfort and efficiency

Not only that, the T-Max™ makes your work more comfortable and generates time savings up to 30% compared to the conventional application methods.

Using this innovative sprayer, you'll soon notice that this strong performer not only supports one person, but can easily support a team of 3 people, applying more than 500m² a day.

One-button control

Simple to operate: put the material in the hopper and choose Air-Assisted (green) or Airless mode (blue). Open your lance and off you go.

Hose

Extremely light and flexible. To tackle bigger jobs: the quick connecting camlock™ system allows you to safely extend hose length up to 30 meters by hand, without using extra tools. Allows complete spraying of a villa with two floors without moving your T-Max™.

Motor

Runs smoothly and only when material is needed. Thanks to the modular design, you can manually disconnect the motor, making it easier to carry for maintenance, or to stow away safely if not in use.

Handles

Mount the handle on the back to move around, or on the front to move like a wheelbarrow: great for climbing stairs!

Mixer mounting kit (optional)

Fix your personal mixer on the T-Max™; adapt the angle for optimal mixing without damaging the hopper. 2 sided mounting options. For interior and exterior mixing.

Hopper

Extra light and with cover, the polymer hopper does not rust. The round shape optimises material suction and is the best design for fast and complete mixing.

Hose hook

The hose hook ensures that your material hose always stays aligned with your sprayer. This makes it easier to get through narrow spaces.

The lance

Quick and clean, opening/closing avoids spitting. The horizontal design generates optimal material passing, avoiding material clogs. Very light and extremely easy to handle.

GOOD TO KNOW

Optimal cleaning design

Our designer team has made sure that daily cleaning is effortless. After rinsing with water, flush the hopper with the large plug. The hopper can easily be disassembled. No need to explain the advantages. The cleaning balls are part of the T-MAX™ packages. Use these to clean your hoses. The special shaped T-MAX™ scraper helps you remove the remaining pieces of dry material. Last but not least: a special tool is delivered to clean the inside of the material filter.

Airless advantages

The very restricted spray fan is typical of airless spraying. This allows you to spray very closely around all obstacles such as windows, doors and other fixed decorations. Simply by moving forwards or backwards from the surface, decide yourself on the width of the spray fan. Close up means a small fan, further away means a wider spray pattern. You will not only need less taping, but also less laying off around all kind of objects on the wall.

TIP!

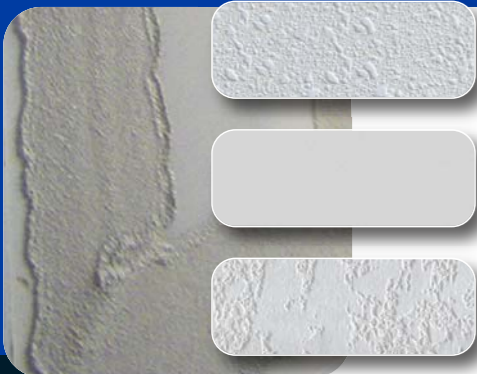

Mount the Fine Finish Kit at the end of the lance whilst spraying air-assisted.

A round spray pattern is typical when spraying decorative material with a compressor and an air nozzle: it's difficult to control and not easy to get an even finish. Experience the difference with Graco's Fine Finish kit. This kit transforms the round spray pattern into a controlled spray fan. Spray decorative materials with airless.

Materials & Applications

The T-MAX™ has been specifically designed to apply most interior plasters and fillers. Using the T-MAX™ in combination with an external compressor, decorative plasters with particles up to 1.5 mm can be sprayed also. The T-MAX™ has been tested and approved to spray the most demanding plasters, mixed or premixed, that are currently on the market.

SmartControl™

The SmartControl™, the electronic brain of the T-MAX™, adjusts the motor to maintain an even spray pattern, which guarantees a constant finish. Browsing through the menu, the display shows interesting information such as pressure, material usage and error codes (self-diagnosis).
